

## Machine Learning ZG565

Dr. Sugata Ghosal Sugata.ghosal@pilani.bits-pilani.ac.in

Session 1
Date – 12<sup>th</sup> November 2022
Time – 4:15 PM to 6:15 PM

These slides are prepared by the instructor, with grateful acknowledgement of many others who made their course materials freely available online.

#### **Session Content**

- Objective of course
- Evaluation Plan
- What is Machine Learning?
- Application areas of Machine Learning
- Why Machine Learning is important?
- Design a Learning System
- Issues in Machine Learning

## **Objective of course**

- Introduction to the basic concepts and techniques of Machine Learning
- Gain experience of doing independent study and research in the field of Machine Learning
- Develop skills of using recent machine learning software tools to evaluate learning algorithms and model selection for solving practical problems

#### What We'll Cover in this Course

- Supervised learning algorithms
  - Regression
  - Naïve Bayes
  - Logistic regression
  - Decision Tree and Random Forest
  - Support vector machines
- Unsupervised learning
  - Clustering
- Applications
- Ensemble Techniques

### **Books**

#### **Text books and Reference book(s)**

T1 Tom M. Mitchell: Machine Learning, The McGraw-Hill Companies

- R1 | Christopher M. Bishop: Pattern Recognition & Machine Learning, Springer
- R2 | P. Tan, et al. Introduction to Data Mining, Pearson
- R3 C.J.C. BURGES: A Tutorial on Support Vector Machines for Pattern Recognition, Kluwer Academic Publishers, Boston.

## **Evaluation Plan**

Name	Туре	Weight
3 Quiz, best 2 scores will be taken	Online	10%
Assignment-I	Take Home	10%
Assignment-II	Take Home	10%
Mid-Semester Test	Closed Book	30%
Comprehensive Exam	Open Book	40%

Please note there will be no change in submission dates for quiz and assignment

#### Lab Plan

Lab No.	Lab Objective
1	End to End Machine Learning
2	Linear Regression and Gradient Descent Algorithm
3	Logistic Regression Classifier
4	Decision Tree
5	Naïve Bayes Classifier
6	Random Forest

- Labs not graded
- Most of the Lab recordings available at CSIS virtual labs
- Webinars will be conducted for lab sessions
- Labs will be conducted in Python

## **Machine Learning**

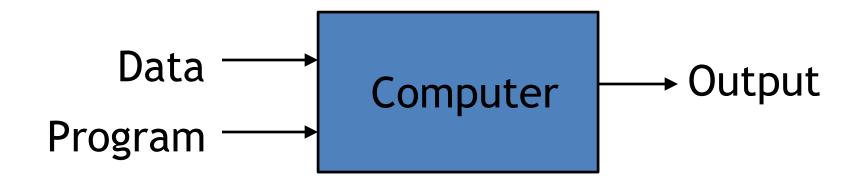

- Machine learning is a scientific discipline that explores the construction and study of algorithms that can learn from data.
- Such algorithms operate by building a model based on inputs and using that to make predictions or decisions, rather than following only explicitly programmed instructions.

#### **A Few Quotes**

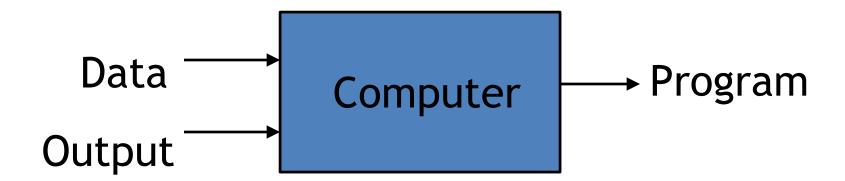

- "A breakthrough in machine learning would be worth ten Microsofts" (Bill Gates, Chairman, Microsoft)
- "Machine learning is the next Internet" (Tony Tether, Director, DARPA)
- "Web rankings today are mostly a matter of machine learning" (Prabhakar Raghavan, Dir. Research, Yahoo)
- "Machine learning is going to result in a real revolution" (Greg Papadopoulos, CTO, Sun)
- "Machine learning is today's discontinuity" (Jerry Yang, CEO, Yahoo)

## **Traditional Programming**

### Machine Learning

## What is Machine Learning?

#### Definition by Tom Mitchell (1998):

"A computer program is said to learn from experience E with respect to some class of tasks T and performance measure P, if its performance at tasks in T, as measured by P, improves with experience E." Example: playing checkers.

E = the experience of playing many games of checkers

T = the task of playing checkers.

P = the probability that the program will win the next game.

## What is Machine Learning?

- To have a learning problem, we must identify
  - The class of tasks
  - The measure of performance to be improved
  - Source of experience

## **Example of Learning Problems**

## **A Checker Learning Problem**

- Task T: Playing Checkers
- Performance Measure P: Percent of games won against opponents
- Training Experience E: To be selected ==> Games
   Played against itself

## A handwriting recognition learning problem

- Task T: recognizing and classifying handwritten words within images
- Performance measure P: percent of words correctly classified
- Training Experience E: a database of handwritten words with given classifications

## A robot driving learning problem

- Task T: driving on public four-lane highways using vision sensors
- Performance measure P: average distance travelled before an error (as judged by human)
- Training experience E: a sequence of images and steering commands recorded while observing a human driver

#### Where does ML fit in?

#### Psychology Physiology

- ·biology of learning
- inspiring paradigms
- Ex: neural networks

## Applied Maths

- optimization
- •linear algebra
- Ex: convex optim

**Applications** 

- new challenges
- Ex: ad placement

Machine Learning

## Computer Science

- •algorithm design
- data structure
- complexity analysis
- •Ex: kd tree

- estimation techniques
- •theoretical framework
- optimality, efficiency
- •Ex: learning theory

**Statistics** 

## Why is Machine Learning Important?

- Some tasks cannot be defined well, except by examples.
- Relationships and correlations can be hidden within large amounts of data. Machine Learning may be able to find these relationships.
- Human designers often produce machines that do not work as well as desired in the environments in which they are used.

## Why is Machine Learning Important?

- The amount of knowledge available about certain tasks might be too large for explicit encoding by humans (e.g., medical diagnostic).
- New knowledge about tasks is constantly being discovered by humans. It may be difficult to continuously re-design systems "by hand".

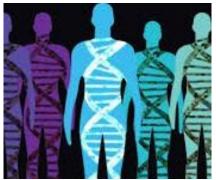

## When Do We Use Machine Learning?

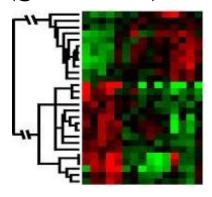

#### ML is used when:

- Human expertise does not exist (navigating on Mars)
- Humans can't explain their expertise (speech recognition)
- Models must be customized (personalized medicine)
- Models are based on huge amounts of data (genomics)

#### Learning isn't always useful:

There is no need to "learn" to calculate payroll

## **Application Domains**

- Web search
- Computational biology
- Finance
- E-commerce
- Space exploration
- Robotics
- Information extraction
- Social networks
- Language Processing
   Many more emerging...

# State of the Art Applications of Machine Learning

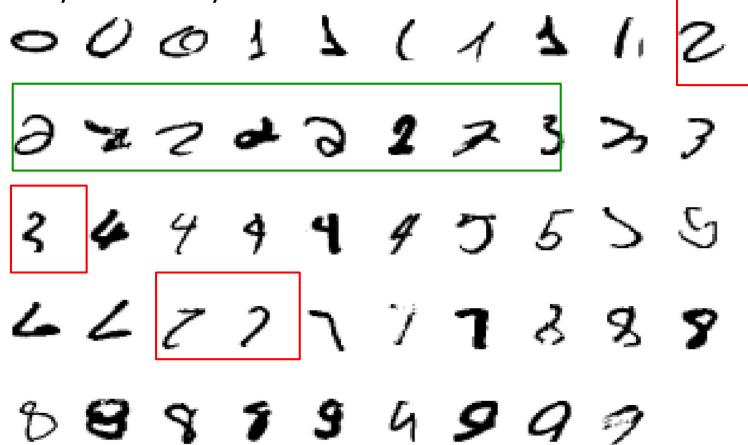

## **Application Types**

- Medical diagnosis
- Credit card applications or transactions
- Fraud detection in e-commerce
- Worm detection in network packets
- Spam filtering in email
- Recommended articles in a newspaper
- Recommended books, movies, music, or jokes
- Financial investments
- DNA sequences
- Spoken words
- Handwritten letters
- Astronomical images

## Pattern recognition

It is very hard to say what makes a 2

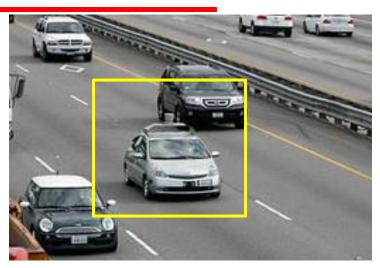

## innovate achieve lead

#### **Autonomous Cars**

- Nevada made it legal for autonomous cars to drive on roads in June 2011
- As of 2013, four states
   (Nevada, Florida, California, and Michigan) have legalized autonomous cars

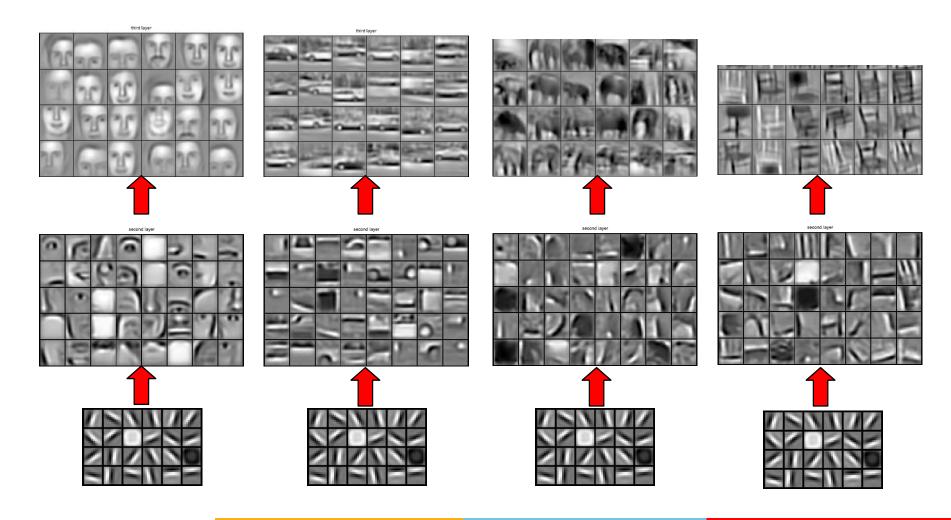

UPenn's Autonomous Car →

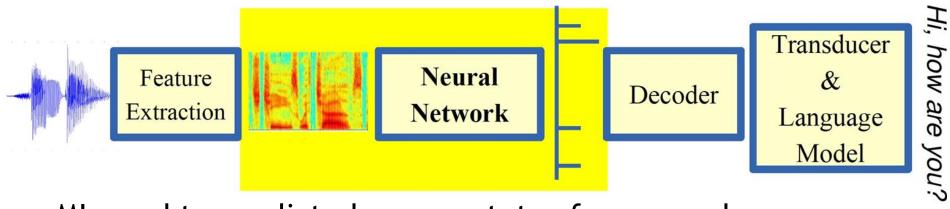

## **Learning of Object Parts**

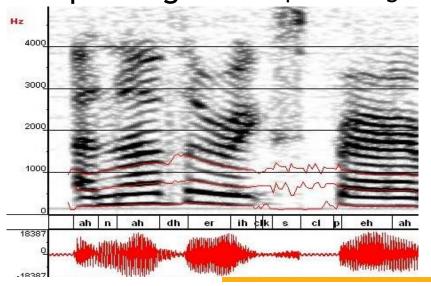

Slide credit: Andrew Ng

BITS Pilani, Pilani Campus

## **Automatic Speech Recognition**

ML used to predict phoneme states from sound spectrogram Deep Learning Based Results

# Hidden Layers	1	2	4	8	10	12
Word Error Rate %	16.0	12.8	11.4	10.9	11.0	11.1

Baseline Gaussian Mixture Model based word error rate = 15.4%

[Zeiler et al. "On rectified linear units for speech recognition" ICASSP 2013]

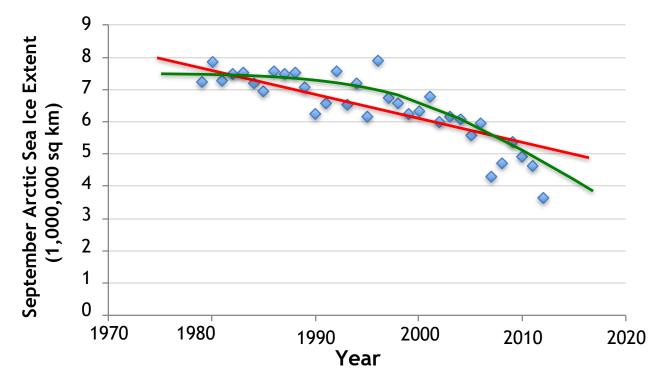

## **Types of Learning**

- Supervised (inductive) learning
  - Given: training data, desired outputs (labels)
- Unsupervised learning
  - Given: training data (without desired outputs)
- Semi-supervised learning
  - Given: training data + a few desired outputs
- Reinforcement learning
  - Given: rewards from sequence of actions

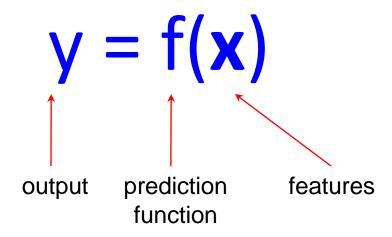

## **Supervised Learning: Regression**

- Given  $(x_1, y_1), (x_2, y_2), ..., (x_n, y_n)$
- Learn a function f(x) to predict y given x

Data from G. Witt. Journal of Statistics Education, Volume 21, Number 1 (2013) Slide Credit: Eric Eaton

#### Regression

- **Training:** given a *training set* of labeled examples  $\{(\mathbf{x}_1, \mathbf{y}_1), ..., (\mathbf{x}_N, \mathbf{y}_N)\}$ , estimate the prediction function f by minimizing the prediction error on the training set
- Testing: apply f to a never before seen test example x and output the predicted value y = f(x)

Slide credit: L. Lazebnik

BITS Pilani, Pilani Campus

#### Classification Example

 Apply a prediction function to a feature representation of the image to get the desired output:

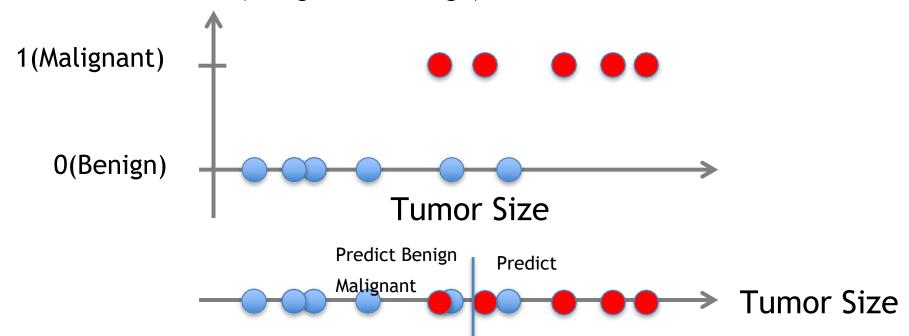

Slide credit: L. Lazebnik BITS Pilani, Pilani Campus

## **Supervised Learning: Classification**

- Given  $(x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)$
- Learn a function f(x) to predict y given x
  - -y is categorical == classification

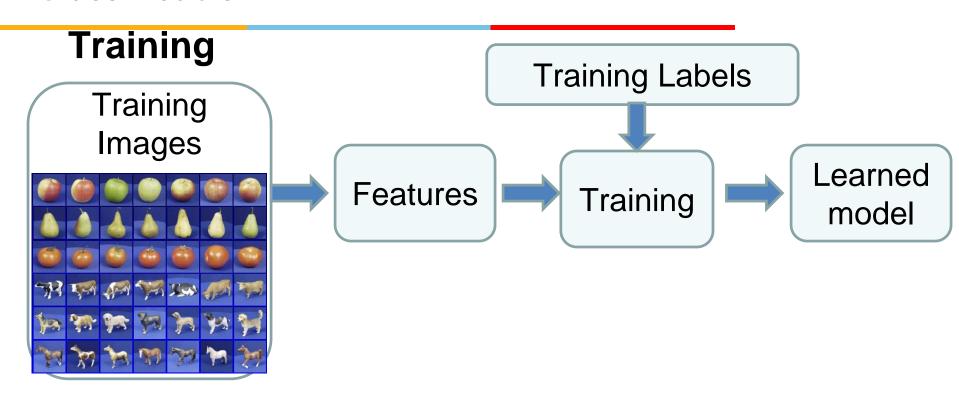

Breast Cancer (Malignant / Benign)

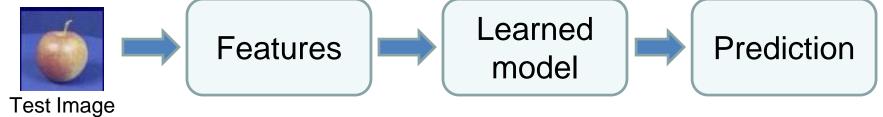

Slide Credit: Eric Eaton

#### Classification

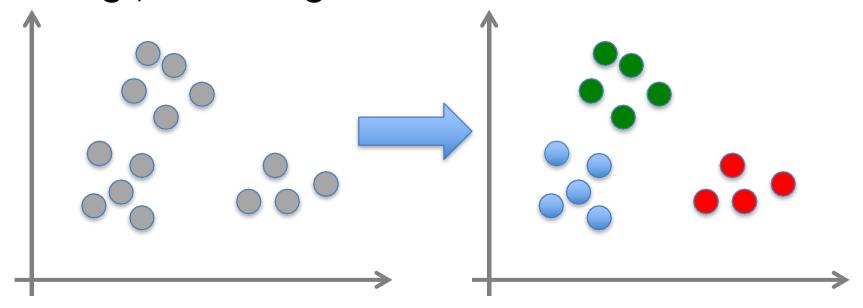

#### **Testing**

## **Unsupervised Learning**

- Given  $x_1, x_2, ..., x_n$  (without labels)
- Output hidden structure behind the x's
  - E.g., clustering

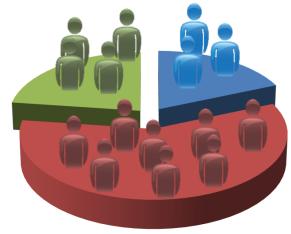

Slide Credit: Eric Eaton

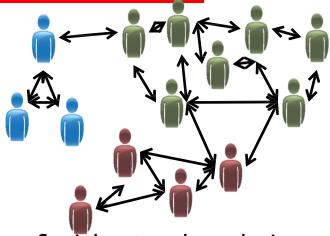

#### **Unsupervised Learning**

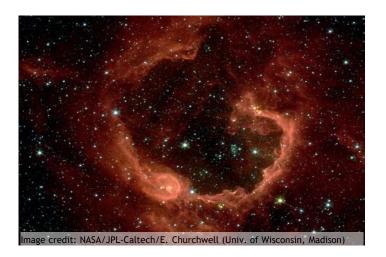

Organize computing clusters

Market segmentation

Social network analysis

Astronomical data analysis

## **Reinforcement Learning**

- No predefined data
- Semi-supervised learning model in machine learning,
- Allow an agent to take actions and interact with an environment so as to maximize the total rewards.
- Examples:
  - Resources management in computer clusters
  - Game playing
  - Robot in a maze

# Supervised, Unsupervised and Reinforcement Learning Comparison

	A	
innovate	achieve	lead
innovate	achieve	lead

Criteria	Supervised Learning	Unsupervised Learning	Reinforcement Learning
Definition	The machine learns by using labeled data	The machine is trained on unlabeled data without any guidance	An agent interacts with its environment by performing actions & learning from errors or rewards
Type of problems	Regression & classification	Association & clustering	Reward-based
Type of data	Labeled data	Unlabeled data	No predefined data
Training	External supervision	No supervision	No supervision
Approach	Maps the labeled inputs to the known outputs	Understands patterns & discovers the output	Follows the trial-and-erro method

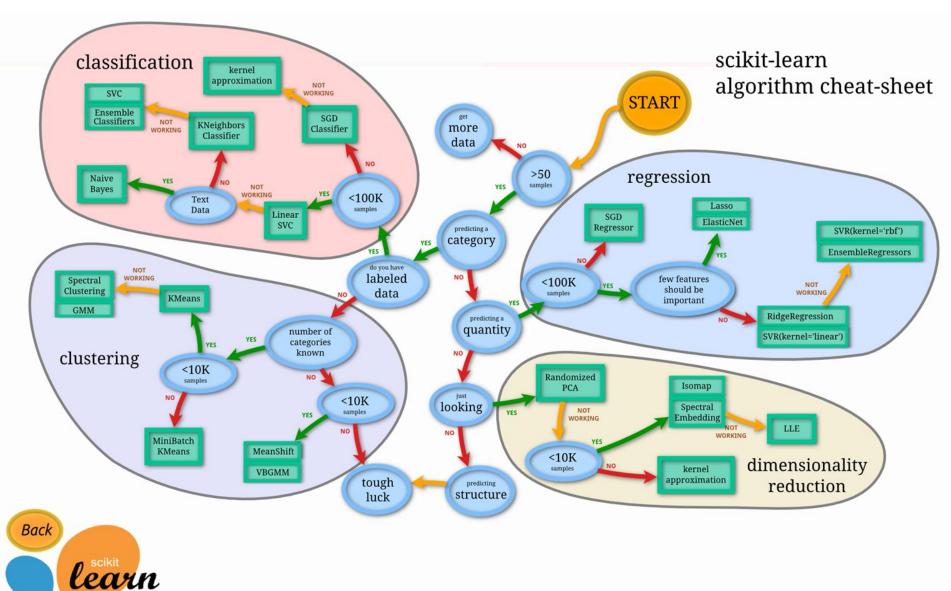

# Open source ML programming tools

	Platform		Algorithms or Features
Scikit Learn	Linux, Mac OS, Windows	Python, C, C++	Classification, Regression, Clustering Preprocessing, Model Selection Dimensionality reduction.
PyTorch	Linux, Mac OS, Windows	Python, C++	Autograd Module, Optimization Module NN Module
TensorFlow	Linux, Mac OS, Windows	Python, C++	Provides a library for dataflow programming.
Weka	Linux, Mac OS, Windows	Java	Data preparation, Classification Regression, Clustering, Visualization Association rules mining

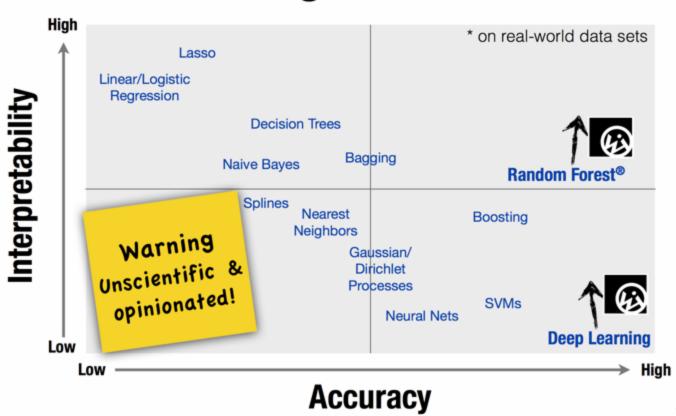

## Open source ML programming tools

Colab	Cloud Service	-	Supports libraries of PyTorch, Keras, TensorFlow, and OpenCV
Apache Mahout	Cross-platform	Java Scala	Preprocessors, Regression Clustering, Recommenders Distributed Linear Algebra.
Accors.Net	Cross-platform	C#	Classification, Regression, Distribution Clustering, Hypothesis Tests & Kernel Methods, Image, Audio & Signal & Vision
Shogun	Windows Linux, UNIX Mac OS	C++	Regression, Classification, Clustering Support vector machines. Dimensionality reduction, Online learning etc.
Keras.io	Cross-platform	Python	API for neural networks

#### **ML Algorithmic Trade-Off**

## ML in a Nutshell

- Tens of thousands of machine learning algorithms
  - Hundreds new every year

- Every ML algorithm has three components
  - Representation
  - Optimization
  - Evaluation

Slide credit: Pedro Domingos

#### **Evaluation**

- Accuracy
- Precision and recall
- Squared error
- Likelihood
- Posterior probability
- Cost / Utility
- Margin
- Entropy
- etc.

#### **Evaluating Performance**

- If *y* is discrete:
  - Accuracy: # correctly classified / # all test examples
  - Precision/recall
    - True Positive, False Positive, True Negative, False Negative
    - Precision = TP / (TP + FP) = # predicted true pos / # predicted pos
    - Recall = TP / (TP + FN) = # predicted true pos / # true pos
  - F-measure = 2PR / (P + R)
- Want evaluation metric to be in some range, e.g. [0 1]
  - 0 = worst possible classifier, 1 = best possible classifier

## **Evaluating Performance**

- If *y* is continuous:
  - Sum-of-Squared-Differences (SSD) error between predicted and true y:

$$\mathbf{E} = \sum_{i=1}^{n} (\mathbf{f}(\mathbf{x}_i) - \mathbf{y}_i)^2$$

## **Issues in Machine Learning**

- What algorithms are available for learning a concept?
   How well do they perform?
- How much training data is sufficient to learn a concept with high confidence?
- When is it useful to use prior knowledge?
- Are some training examples more useful than others?
- What are the best tasks for a system to learn?
- What is the best way for a system to represent its knowledge?

## Training vs Testing

- What do we want?
  - High accuracy on training data?
  - No, high accuracy on unseen/new/test data!
  - Why is this tricky?
- Training data
  - Features (x) and labels (y) used to learn mapping f
- Test data
  - Features used to make a prediction
  - Labels only used to see how well we've learned f!!!
- Validation data
  - Held-out set of the training data
  - Can use both features and labels to tune parameters of the model we're learning

**BITS** Pilani

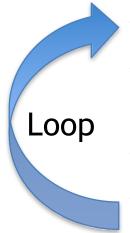

#### Training vs. Test Distribution

- We generally assume that training and test examples are independently drawn from the same overall distribution of data
  - We call this "i.i.d" which stands for "independent and identically distributed"

Slide credit: Ray Mooney

#### ML in Practice

- Understand domain, prior knowledge, and goals
- Data integration, selection, cleaning, preprocessing, etc.
- Learn models
- Interpret results
- Consolidate and deploy discovered knowledge
